**Notes:**

<sup>a</sup> Proposed crossing method is based on Rev C route for Mainline and PTTL. No waterbodies are crossed by the Liquefaction Facility. Aerial crossings are aboveground with no impact to waterbodies.

<sup>b</sup> Flow regime based on USGS National Hydrographic Dataset (NHD) and LiDAR imagery. Perennial = PN; Perennial – Multiple = PNM; Intermittent = IN; Artificial Path = AP; and Pond/Open Water = P.

<sup>c</sup> Based on the FERC staff’s Wetland and Waterbody Construction and Mitigation Procedures (2013) definitions for waterbodies, includes any natural or artificial stream, river, or drainage with perceptible flow at the time of crossing, and other permanent waterbodies such as ponds and lakes. Minor Waterbodies are those that are less than or equal to 10-feet-wide from water’s edge to water’s edge at the time of crossing; Intermediate Waterbodies are those that are greater than 10-feet-wide but less than or equal to 100-feet-wide (water’s edge to water’s edge); and Major Waterbodies are those greater than 100-feet-wide from water’s edge to water’s edge at the time of crossing.

<sup>d</sup> Preliminary construction wetted width for waterbodies with perceptible flow at the time of crossing. Waterbodies that are dry or frozen to the bed will be crossed using standard upland construction techniques in accordance with the *Alaska LNG Project Plan and Procedures*.

<sup>e</sup> Based on USGS Watershed Boundary Dataset (WBD) 8-digit hydrologic unit (HUC8).

<sup>f</sup> ADEC Waterbody Classifications (2013). Category 1 - All WQS for all designated uses are attained; Category 2 - Some WQS for the designated uses are attained, but data and information to determine whether the WQS for the remaining uses are attained are insufficient or absent; and Category 3 - Data or information is insufficient to determine whether the WQS for any designated uses are attained.

<sup>g</sup> No potable surface water resources three miles downstream from any waterbody crossing.
